

WordPerfect[®]

for the Amiga

WordPerfect® for the Amiga

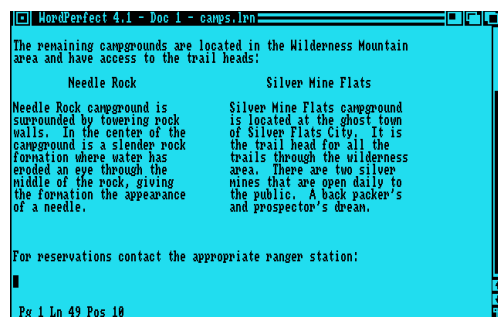

Featuring the power and flexibility of the PC version, and adapted to the strengths of the Amiga itself, WordPerfect sets a new standard for word processing on the Amiga.

Flexibility

In addition to WordPerfect's PC-consistent function-key commands which have been fully implemented, you have the option of using convenient pull-down menus with the Amiga mouse.

Columns

The Columns feature lets you display as many as five text columns, side-by-side, on the screen. You can choose newspaper-style columns (for a newsletter) where the text flows up and down through the columns, or parallel-style columns (for an inventory list) where the text flows across the columns.

Footnotes/Endnotes

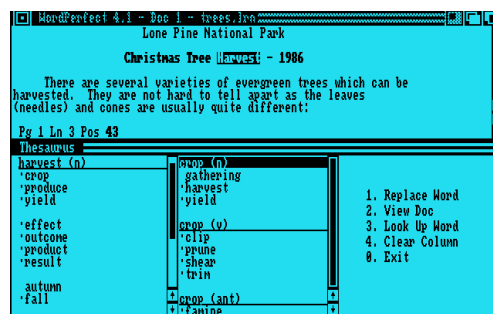

With the Footnote feature, numbers are automatically inserted, footnotes are properly placed, endnotes are compiled at the end of the document, and several options let you quickly change the style. You can even have footnotes and endnotes in the same document.

Support

Free support is available to help you find the answers you need to fully utilize WordPerfect.

Thesaurus

The WordPerfect thesaurus enhances your ability to choose just the right word for each application. It contains synonyms and antonyms for thousands of words.

Speller

WordPerfect's spell-checker (115,000 words) is one of the largest integrated spellers on the market. It examines documents for spelling errors and unintentional double words, and also provides a word count.

Printers

WordPerfect supports over 200 printers, including dot-matrix, daisy-wheel, and laser. You can select up to six different printers for your system.

Merge

WordPerfect's Merge feature lets you combine data from two or more different sources into a single document. With a wide variety of options available, you can use Merge to customize mass-mailings, create reports and lists, and automate office procedures to increase productivity.

Features Include

- Align on any character
- Automatic formatting
- Automatic hyphenation
